

WHAT IS CLAIMED IS:

1           1. A method of providing an identifier for a file, said method comprising:  
2           accessing said file;  
3           deriving a frequency representation of said file;  
4           providing a file name for said file;  
5           providing said file name in a directory;  
6           associating said frequency representation of said file with said file name so  
7        that said frequency representation is accessible via said directory.

1           2. The method as described in claim 1 wherein said frequency  
2        representation comprises a Fast Fourier Transform.

1           3. The method as described in claim 1 and further comprising:  
2           configuring an address listing with an identifier for said frequency  
3        representation.

1           4. A method of searching for a file, said method comprising:  
2           obtaining a first frequency representation of a desired file;  
3           accessing a first unknown file;  
4           obtaining a second frequency representation of said unknown file;  
5           comparing said first frequency representation with said second frequency  
6        representation; and  
7           determining from said comparing whether said unknown file is said desired  
8        file.

1           5. The method as described in claim 4 wherein said obtaining said first  
2        frequency representation of said desired file comprises:  
3           performing a Fast Fourier Transform algorithm.

1                 6.     The method as described in claim 4 wherein said obtaining said first  
2 frequency representation comprises performing a Discrete Fourier Transform.

1                 7.     The method as described in claim 4 wherein said comparing said first  
2 frequency representation with said second frequency representation comprises:

3                         comparing a range of frequencies of said first and second frequency  
4 representations.

1                 8.     The method as described in claim 4 and further comprising:  
2                         decoding said unknown file.

1                 9.     A method of determining redundancies in a content object directory,  
2 said method comprising:

3                         accessing a plurality of files stored on a memory, wherein each of said files is  
4 configured so as to be identified by a fingerprint;

5                         for each of said files, determining said fingerprint;

6                         establishing a redundancy standard so as to indicate whether any two of said  
7 fingerprints of said files are redundant of one another;

8                         comparing said fingerprints determined for each of said files;

9                         determining redundant files based upon said comparing said fingerprints and  
10 said redundancy standard.

1                 10.    The method as described in claim 9 and further comprising:

2                         deleting at least one redundant file from said memory.

1                 11.    The method as described in claim 9 and further comprising:

2                         utilizing a Fast Fourier Transform algorithm to compute said fingerprint.

1                 12.    The method as described in claim 9 and further comprising:

2                         utilizing a watermark as said fingerprint.

1           13.     The method as described in claim 9 and further comprising:

2                 utilizing cyclical redundancy check data as said fingerprint.

1           14.     The method as described in claim 9 wherein said accessing a plurality

2     of files comprises:

3                 accessing a plurality of files comprising video data.

1           15.     The method as described in claim 9 wherein said accessing a plurality

2     of files comprises:

3                 accessing a plurality of files comprising audio data.

1           16.     The method as described in claim 9 wherein said establishing a

2     redundancy standard comprises:

3                 determining a range of frequencies in a pattern of frequencies from a Fast

4     Fourier Transform for comparison of said fingerprints.

1           17.     The method as described in claim 9 and further comprising:

2                 appending a fingerprint as metadata to at least one directory listing.

1           18.     The method as described in claim 9 and further comprising:

2                 cataloging in a database said fingerprint with the file from which said

3     fingerprint was generated.
